Operation and Maintenance Guide

Corner Applicator

Operation and Maintenance Guide

Model: *CA08-AD*

Operation

The corner applicator works in conjunction with the 2.5" (64 mm) angle head and the 3" or 3.5" (75mm or 89 mm) adjustable angle heads. This tool allows the operator to put a consistent finish coat to both sides of a corner at one time.

The angle head is attached to the corner applicator by inserting the cone/ball end of the applicator into the insert socket of the angle head. The Corner Applicator is then attached to the FH-AD Fiberglass Handle or XH-AD Extension handle for use.

The corner applicator is filled by using the Loading Pump with the filler adapter. To fill the corner applicator, turn it on its side and insert the filler attachment of the applicator into the filler adapter (without the slot adapter) of the Loading Pump. The corner finisher should be over the edge of the joint compound bucket. Pump the corner applicator until it is full.

The corner applicator is a pressure controlled tool. Therefore, for best results, even pressure should be applied. Hold the support handle with both hands, one near the end of the handle and the other close to the applicator. When the angle head is set in the corner, all blades should be flush with the sides of the corner. The cone/ball of the corner applicator should be kept straight in the insert socket of the corner finisher and centered in the corner being finished (no tilt to either side).

To finish vertical corners, set the angle head near the bottom of the vertical corner with the blade end closest to the floor. Apply pressure, with the handle, to the applicator pressure plate, pull up about 24" – 36" (0.75 to 1 meter) and then sweep the angle head away from the corner. Turn the corner applicator around and set the angle head in the top of the corner, pull down through the bottom joint compound mark and sweep it away from the corner.

For horizontal corners, set the angle head at one end of the corner, apply pressure to the applicator and pull it to the opposite corner. As you near the opposite corner, sweep the angle head away from the corner. Turn the corner applicator around and set it in the opposite corner from where you started. Apply pressure, pull the angle head back through the edge of the first joint compound and sweep the corner applicator away from the joint.

For the easiest operation, keep the handle at a 45 degree angle to the adjacent surfaces, keep the corner finisher set flush in the corner and keep the outlet cone straight in the corner finisher.

Maintenance

Clean thoroughly with a brush and water (or a water hose) to remove all joint compound from the tool. Pay close attention to insure that the filler attachment is completely cleaned of all joint compound. Then, after the tool is clean, lightly oil with TapeTech® Bazooka® Oil or any light machine oil.
